StacksBit

Trust infrastructure for digital commerce

Enabling buyers and merchants who don't know each other to transact safely through blockchain escrow, dispute resolution and on-chain merchant reputation.

BOT Chain Ecosystem Support & Incentive Program Application

CURRENT STATUS (OCTOBER 2026)

Pre-launch · BOT Chain testnet pilot, test tokens only · Contract unaudited, v2 fix in progress · No production volume

Terkaa Tarkighir (Rogers) · Jos, Plateau State, Nigeria
rogersterkaa@gmail.com · stacksbit-react.vercel.app

THE PROBLEM

Commerce breaks down when trust is missing

In Nigeria and across Africa, buyers fear paying for goods they never receive, while merchants fear shipping products without guaranteed payment. Traditional payment systems transfer money, but they don't establish trust.

"Send money first and pray."

This is how many small merchants and their customers transact today.

100%

of the merchants we interviewed in Jos, Nigeria had been defrauded

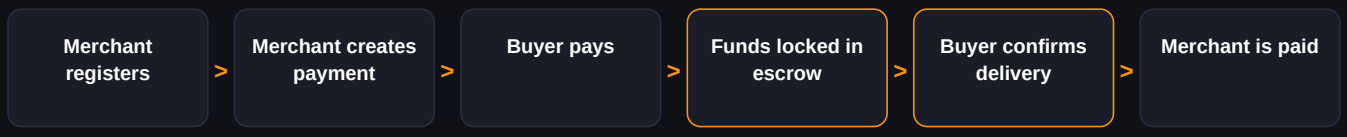
Both

buyers AND merchants are victims, not just one side

Source: structured merchant validation in Jos, Q2 2026 (Stacks Foundry Validate). This is an early, small sample, not a market-wide statistic.

THE SOLUTION

A blockchain-enforced trust layer, not just a payment app



- **Escrow:** funds are held by the contract, not the merchant.
- **Buyer confirmation:** only the buyer can release funds, so a merchant cannot release them to themselves.
- **Disputes:** either side can raise a dispute; funds stay locked until the contract owner resolves it.
- **Reputation:** the contract tracks each merchant's volume, completed payments and disputes.
- **Multi-chain design:** the same escrow logic has been built for Stacks, Flare and BOT Chain. BOT Chain is now the primary focus.

StacksBit is not a payment gateway. It is trust infrastructure — escrow is the mechanism, not the product.

BUSINESS MODEL

2.5% fee on every confirmed transaction

No subscription and no upfront cost for merchants. The contract takes the fee when the buyer confirms delivery, so revenue scales directly with transaction volume. StacksBit has no revenue yet: it is pre-launch.

Example transaction (illustrative)

NGN 50,000 order
NGN 1,250 StacksBit fee
Merchant receives NGN 48,750

Naira pricing is planned. Current testnet settlement is in BOT.

Revenue per NGN 1M of transactions

NGN 25,000

2.5% of transaction value

VERIFIED ON-CHAIN IN THE TESTNET PILOT

A 0.1 BOT payment was released as **0.0975 BOT to the merchant** and **0.0025 BOT fee** (2.5%), recorded in the contract's DeliveryConfirmed event.

Planned, not yet built: dispute resolution fees, premium merchant tiers, and USSD confirmation service fees.

CURRENT STAGE

Where StacksBit is today

- **Mainnet contract verified:** escrow contract live on BOT Chain mainnet (Chain ID 677) at 0x7D4d65AA41dA0e321ad52e46E9120F07D55B5284. No real funds yet; the full mainnet escrow test is still to do.
- **Testnet pilot complete:** two full escrow flows run on BOT Chain testnet (test tokens) with Nigerian merchants: LiveBetter Fashion (payment 6) and 4-Keeps Enterprise (payment 7).
- **Fee and payout verified on-chain:** a 0.1 BOT payment released as 0.0975 BOT to the merchant plus a 0.0025 BOT fee.
- **Working web app:** stacksbit-react.vercel.app (React + TypeScript, MetaMask). Merchant and buyer roles, a buyer Confirm Delivery step, plain-English error messages, and a pre-send payment check.
- **Automated tests:** 7 contract tests passing (Hardhat).
- **Earlier versions:** Stacks Clarity contracts (the Stacks testnet was reset and the deployment can be redone) and a Flare Coston2 Solidity version.
- **Security review:** our own review found a critical flaw in the deployed v1 contract (the owner could withdraw buyers' locked funds). A v2 draft fixes it and is not yet deployed or audited. See pages 9 and 10.

HONEST STATUS

Pre-launch. BOT Chain testnet, test tokens only. No production volume. Contract not yet audited. No real customer funds until the security review is complete.

ON-CHAIN EVIDENCE

Two merchant flows on BOT Chain testnet

Test tokens only. Explorer: scan.bohr.life. Testnet contract: 0xd0D794E8ea1B7048a1E0F9afddB188a309EA6F66.

LiveBetter Fashion — payment 6 (buyer: founder's test wallet)

Step	Transaction hash
Register merchant	0x2918a9bd41...347648ab
Create payment	0x1168834874...464f2046
Pay invoice	0xb5b272648d...dd057ee2
Confirm delivery	0x6ffe6e7970...4f74f12d

4-Keeps Enterprise — payment 7 (independent buyer)

Step	Transaction hash
Register merchant	0x8c94dde931...bc4ac912
Create payment	0x16e9ec044d...b0257e87
Pay invoice	0x6f3ad67d04...6659107a
Confirm delivery	0x399de08c62...a4d59b77

Full hashes and the DeliveryConfirmed events are on the testnet explorer, and available on request.

VALIDATION EVIDENCE

Validated with real merchants in Nigeria

5-week structured validation through Stacks Foundry Validate (Q2 2026): every merchant interviewed confirmed bilateral fraud pain. Two independently asked, "What does the customer need to do?" Since then, two merchants have run full testnet escrow flows.

Actor	Type	Signal
Owner, 4-Keeps Enterprise (real estate and property management)	Merchant	Completed a full testnet escrow flow with an independent buyer (payment 7)
Jaram Comfort Mayat, LiveBetter Fashion	Merchant	Confirmed fraud pain; completed a full testnet escrow flow (payment 6)
Donald Aondoakura, Errandboy Logistics	Merchant	Completed walkthrough; asked "what do I do next?" — strong follow-through
Elias Ahile, Brisk Global	Merchant	Multiple follow-up calls; asked specifically about dispute resolution time
Lucy Ejembi	Buyer	Opened the app independently and explored the full flow without prompting
Tristan Linardos, Lorica Labs	Ecosystem	Sustained architectural engagement; open channel maintained

Key reframe: we entered validation believing we were building merchant protection. We left building trust infrastructure for both sides of every transaction.

MULTI-CHAIN ARCHITECTURE

The trust logic is the product; the network is where it settles

Chain	Language	Status	Asset
BOT Chain (EVM L1) — primary	Solidity	Mainnet contract verified; testnet pilot with two merchants complete	BOT
Stacks (Bitcoin L2)	Clarity	Contracts built; testnet was reset, deployment can be redone	sBTC
Flare (EVM L1)	Solidity	Coston2 testnet version verified earlier (historical)	FLR

Why BOT Chain is our focus

- **No rewrite needed:** the same Solidity escrow design, already built and pilot-tested, is deployed and verified on BOT Chain. v2 will be redeployed there after testing.
- **One primary deployment:** BOT Chain is where we are focusing; Stacks and Flare remain reference implementations.
- **Same user flow everywhere:** register, invoice, escrow, confirmation, settlement.
- **Natural on-chain activity:** every registration, payment and delivery confirmation is a real transaction by a real user.
- **Planned fit with BOT Chain's AI direction:** a fraud-risk layer is on our roadmap (not built yet).

SECURITY REVIEW

We found a critical flaw in our own contract

CRITICAL · DEPLOYED v1 CONTRACT

withdrawFees() sends the owner the contract's entire balance, not only the platform fees. Buyers' locked escrow funds sit in the same balance.

Example: buyers have 30 BOT locked in escrow and platform fees are 1 BOT. The owner calls withdrawFees() and receives 31 BOT, not 1.

- **Why it matters:** locked funds would not be protected from the owner. That breaks the core promise of the product.
- **Exposure:** none in practice. v1 has only held test tokens, and no real customer funds have been locked in it.
- **How it was found:** in an internal, AI-assisted code review before any audit. We are disclosing it ourselves.
- **What we did:** wrote a v2 contract that fixes it, plus the other issues the review raised (next page). v1 stays as deployed.
- **What held up:** only the buyer can release funds, and contract state is updated before any funds move.

No real funds are used until v2 is tested, redeployed and audited. Finding this before launch is the reason we plan an audit and a security review first.

CONTRACT V2 (DRAFT)

What v2 changes and what is still open

Severity	Finding in v1	Fix in v2
Critical	Owner fee withdrawal could send out locked buyer funds	Fees tracked separately. Only accumulated fees can be withdrawn.
High	No delivery deadline: funds could stay locked indefinitely	Merchant sets a 1-14 day window. Buyer can claim a refund after it. Merchant can claim if the buyer is inactive 7 days later.
High	Buyer chooses the amount; the agreed price is not enforced	Merchant sets the price. Buyer must pay at least that. Overpayment is an optional tip.
Medium	Dispute outcomes not reflected in merchant reputation	Outcomes update completed and refunded counts. Risk score uses refunds.
Medium	No reentrancy guard, no emergency pause, no ownership transfer	Reentrancy guard. Pause for new activity only. Ownership can move to a multisig.
Medium	Merchant could pay their own invoice to inflate volume	Blocked in the contract.
Low	Locked-funds view looped over every payment	Running total with constant cost.
Low	Misleading error for non-participants raising a dispute	Clear NotParticipant error.

STATUS OF v2

Draft, **not deployed and not audited**. It compiles and passed 44 local scenario checks (fee isolation, refunds, deadlines, disputes, pause). Still to do: a full Hardhat test suite, a testnet redeploy and the audit. Source: github.com/rogersterkaa/stacksBit-flare, branch v2-draft.

STILL OPEN

Disputes are resolved by a single owner (multisig planned, DAO governance later). No timeout on an unresolved dispute. The merchant contact string is public chain data. No audit yet. No real-funds test on mainnet.

LAUNCH BLOCKERS AND ROLLOUT

What stands between testnet and mainnet

Launch blocker	Plan
Contract v2: tests and redeploy	v2 draft is written. Add a full test suite, redeploy on testnet, then repeat a merchant pilot
Security audit	CertiK audit of v2, scoped after the tests
Full mainnet escrow test	Team-run, small amounts, on the redeployed v2 contract once gas is available
More merchant pilots	Repeat testnet pilots with more Nigerian merchants, then Jos to Lagos
Real customer funds	Only after the security review is complete

Proposed rollout (dates to be agreed with the BOT Chain team)

NOW

- Testnet pilots with two Nigerian merchants
- Mainnet v1 contract verified
- v2 contract draft written
- Web app live

NEXT

- v2 tests and redeploy
- CertiK audit
- Small-amount mainnet test
- Limited mainnet launch with onboarded merchants

LATER

- USSD confirmation (Africa's Talking)
- Naira pricing
- Fraud-risk intelligence
- Identity and reputation network
- DAO dispute governance

THE ASK

BOT Chain Ecosystem Support — Option C

StacksBit is applying for Community Growth Support to help bring merchants and buyers onto BOT Chain once the security review is complete. Every registration, payment and delivery confirmation is a real transaction by a real user. We will not use team wallets to inflate activity.

Mainnet readiness

Redeploy v2, then a small-amount mainnet test

Merchant acquisition

Jos, then Lagos, then wider Africa

USSD backend

Africa's Talking API integration (planned)

Security audit

Pre-mainnet audit of v2, CertiK route

Any support, scope and milestones remain subject to BOT Chain's internal review and formal cooperation process.
